

****NOTE**

This happens because you have installed the latest numpy version 1.24.0 where np.int is depreciated. Instead install a lower version of numpy pip install "numpy<1.24.0".

Or you can change the np.int to just int. However, there are still some issues with tensorboard logging with the latest numpy version, so better to downgrade.

This is a fix that need to be done to run the code and there is no other solution available for that issue. From this to fixations I have done the second one.

- Open to the error directory and change np.int to int

This should solve the issue.
